Rush search for 09/499,662 Subject:

The case is due this bi-week. Would you please approve rush search for SEQID No:107 and 117? Thank you.

The humanised antibodies are used to evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lupus erythematosus, Hashimoto's disease, graft versus host disease, Sjogren syndrome, perulcious anaemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, rheumatoid arthritis, autoimmune haemolytic anaemia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            chain of murine anti-human Fas monoclonal antibody HFETA.

Humanisation of the murine sequence (see AAW83042) entailed making
DIE, P47A, K49R, H80S, P81R, V82L, B84P, A87F, T89V and R107K
amino acid substitutions; these residues are conserved in the
human light chain (kappa chain). Host cell Escherichia coli
pHSHH5 SANK 7039B harbors plasmid pHSHH5 carrying a fusion
fragment of the humanised PHH type HFETA light chain and DNA
encoding the region of human immunoglobulin kappa chain, and is
deposited as FERM BP-6274 (claimed). The invention provides
methods for producing humanised antibodies by culturing host
cells. Humanised versions of HFETA (see AAW83031-37), like native
HFETA, are capable of inducing apoptosis in abnormal cells
expressing Fes, and of inhibiting Fes. induced apoptosis in normal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antibodies and proteins bind conserved epitope of Fas antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This is the amino acid sequence of the PDHH type humanised light
                                                                                                                                                                                                                                                                                                                                                                                                                                  un O, Kimihisa I;

Anti-Fas antibody; monoclonal antibody HFE7A; FERM-BP-5828; murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas Iigand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; light chain.

Humanised anti-Fas antibody light chain, SEQ ID NO:107.

(first entry)

24-NOV-2000

AAB14777;

```
(complementarity determining regions) to antibody HEFA. Wis its interaction with Fas, the antibody of the invention acts as a modulator of apotosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephiris, apleastic anaemia (panmyelophibisis), hepatitis, AIDS and organ graft rejection. Sequences ABB14772-B14774 and AAB14777-B14778 represent the light chains of several humanised HPE7A-derived anti-Fas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFE7A, or a humanised version of HFE7A containing identical CDRs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral, immunomodulatory, dermatological, immunosuppressive, thyromimetic, antishtemmatic, nephrotropic, antiinfertility, neuroprotective, antistreriosclerotic, cardiant and hepatropic activity. (1) induce

apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic lupus erythematosus, Hashimoto disease, remark at the sase, Siorgen's syndrome, pernicious or hypoplastic versus host disease, Siorgen's syndrome, Tornicious or hypoplastic canemia, Addison's disease, scleroderma, Goodpastures syndrome, Crohn's disease, autoimmune hemolytic anemia, sterility myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin candiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they minic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a humanised anti-Fas antibody HRE7A designed light chain which is used in the method described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 QQKPGQAPRLLIYAASNLESGIPDRFSGSGSGTDFTLTISRLEPEDFAVYYCQQSNEDPR 120

This is the amino acid sequence of the HH type humanised light chain of murine anti-buman Fas monoclonal antibody HFE7A.

Humanisation of the murine sequence (see AARB3042) entailed making b47A, K49R, H80S, P81R, V82L, E84P, E85A, A87F and T89V amino acid substitutions; these residues are conserved in the human light chain (kappa chain). Host cell Escherichia coli pHSGHH7 SANK 73497 HH type HFE7A light chain and DNA encoding the region of humanised immunoglobulin kappa chain, and is deposited as FERM BP-6073 antibodies by culturing host cells. Humanised versions of HEF7A (see AAWB301-37), like native HFE7A, are capable of inducing humanised second antibodies by culturing host cells. Humanised are spable of inducing humanised second antibodies and second antibodies of inducing humanised second antibodies of inducing humanised second antibodies by culturing host cells. Humanised are apable of inducing second antibodies and second antibodies and second seco
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sjögren syndrome, pernicious anaemia, Addison's disease, scleroderma Goodpasture syndrome, Crônh's disease, rheumatoid arthritis, autoimmune haemolytic anaemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetees), allergies, atopy, arteriosclerosis, amyocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antibodies and proteins bind conserved epitope of Fas antigen - used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           apoptosis in abnormal cells expressing Fas, and of inhibiting Fas-induced apoptosis in normal cells. The humanised antibodies are used to evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lupus erythematosus, Hashimoto's disease, graft versus host disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Jun O, Kimihisa I; , Tohru T;

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (pannayelophthisis), hepatitis, AIDS and organ graft rejection. Sequences ABBH4777-BH4778 represent the light chains of several humanised HFE7A-derived anti-Fas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Anti-Fas antibody; monoclonal antibody HFE7A; FERM-BP-5828; murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains

The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New humanized anti-Fas antibody, useful for treating or preventing e.g.

immunomodulatory, dermatological, immunosuppressive, thyromimetic,
antirheumatic, nephrotropic, antiinfertility, neuroprotective,
antiarteriosclerotic, cardiant and hepatropic activity. (1) induce
apoptosis by binding to call surface Fas or inhibit it by competitive
inhibition of ligand binding. (1) are used to treat and/or prevent
diseases associated with the Fas/Fas ligand system, especially systemic
consists, addison's disease, scleroderma, footpasture syndrome, round, and the menolytic anemia, sterility, myasthenia gravis,
and tiple sclerosis, Basedow's disease, thrombopenia purpura, insulin
dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis,
cardiomyopathy, glomerulonephritis, hepatitis (fulminat, chronic, viral
(B, C or D) or alcoholic), and transplant rejection. (1) selectively
inhibit apoptosis in normal cells but selectively induce it in abnormal
cells. They bind to both human and murine Fas, so can be evaluated in
murine disease models. (1) act on the active site of Fas, i.e. they mimic
the native ligand, do not induce liver disease, and have reduced risk of
inducting a human anti-murine antibody response. This sequence represents
a humanised anti-murine antibody response. This sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ÷

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a bumanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA, via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or pervention of conditions such as autofimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. Sequences ABB14772-B14774 and AABH4777-B14778 antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Anti-Fas antibody; monoclonal antibody HFE7A; FERM-BP-5828; murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autolimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains

apoptosis in cells with a normal system, by inhibiting binding between and its ligand. The products of the invention have anti-inflammatory, anti-diabetic, anti-allergic, anti-architic, anti-inflammatory, interpolaries, anti-diaperssive, thyromimetic, anti-demmatic, nephrotropic, anti-infertility, neuroprotective, anti-inflammatory, cardiant and hepatropic activity. (I) induce anti-architic anti-architic, and ligand binding to call surface Fas or inhibit it by competitive apoptosis by binding to call surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic lupus erythematosus, Hashimot disease, rhemmatoid arthritis, graft or ersus host disease, soleroderma, Goodpasture syndrome, con-inhibit and disease, soleroderma, Goodpasture syndrome, con-inhibit and disease, autoimmune hemolytic anemia, sterility myasthenia gravis, multiple sclerosis, Basedowk disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they minic the number and anti-murine antibody response. This sequence represents and human anti-murine disease, and have reduced risk of a humanised anti-pad antibody response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                121 TFGQGTKLEIKRTVAAPSVFIFPPSDEQLKSGTASVVCLLNNFYPREAKVQWKVDNALQS 180

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, arctariosclerosis, myocarditis, cardiomyopathy, allergy and pastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This is the amino acid sequence of the HM type humanised light chain of murine anti-human Fas monoclonal antibody HFE7A. Humanisation of the murine sequence (see AAW83042) entablied making P47A and K49R amino acid substitutions: these residues are conserved in the human light (kappa) chain. Host cell E. coli pHSGHM17 SANK 73597 harbors plasmid pHSGHM17 carrying a fusion fragment of the humanised HW type HFE7A light chain and bNA encoding the region of human immunoglobulin kappa chain, and is methods for producing humanised antibodies by culturing host cells. Humanised versions of HFE7A (see AAW83031-37), like native HFE7A, are capable of inducing apoptosis in abnormal cells expressing Fas, and of inhibiting Fas-induced apoptosis in normal cells. The humanised antibodies are used to evaluate, in animal cells. The humanised antibodies are used to evaluate, in animal interactions, and also to treat such diseases, including autoinmune disease (e.g. systemic lupus erythematosus, Hashimoto's disease, gaft versus host disease, Sjogren syndrome, pernicious anaemia, addison's disease, rheumatoid arthritis, autoimmune haemolytic anaemia, thrombopenia purpura and insulin-dependent diabetes), allergies, atoin, all listand, and insulin-dependent diabetes), allergies, cachory, arteriosclerosis, myocarditis, cardiomyopathy, glomerular computatic anaemia, hepatitis, ABDS and transplant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antibodies and proteins bind conserved epitope of Fas antigen used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis,

This invention describes a novel humanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between captoriosis in cells with a normal system, by inhibiting binding between the apoptosis in cells with a normal system, by inhibiting binding between captoriosis antidiabetic, anti-allergic, anti-arthritic, antiviral, immunomodulatory, dermatological, immunosuppressive, thyromimetic, antiarrefrosciancic, cardiant and hepatropic activity. (I) induce antiarrefrosciancic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive capportosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent capoptosis by binding to cell surface Fas or inhibit it by competitive captorios. (I) upus crythematosus, Hashimoto disease, remained arthritis, graft versus host disease, sloracderme, pernicious or hypoplastic versus host disease, sloracderme, coodpasture syndrome, crohn's disease, auterioral approach size and and a stretioscial pupus arterioscial pupus arterioscial pupus arterioscial pupus arterioscial pupus, mornal calls but serviced for a disease, and hase models in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they minic cells. They bind to both human and murine Fas so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they minic a human anti-murine anti-body response. This sequence represents a humanised anti-Fas antibody response. This sequence represents the method described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

chain of murine anti-human Fas monoclonal antibody HFE7A. E. coli chain of murine anti-human Fas monoclonal antibody HFE7A. E. coli cank 73697 harbors plasmid pHSGMMG carrying a fusion fragment of the humanised MM type HFE7A light chain and DNA encoding the region of humanised MM type HFE7A light chain and DNA encoding the region of humanised MM type HFE7A light chain and DNA encoding the region of humanised must be seen antibodies by culturing host cells. Humanised versions of HFE7A (see AAM83031-37), like native HFE7A, are capable of inducing apoptosis in abnormal cells expressing Fas, and of inhibiting Fas-induced apoptosis in normal cells. The humanised antibodies are used to evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune cisases (e.g. systemic lupus crythematosus, Hashimoto's disease, graft versus host disease, scleroderma, Goodpasture syndrome, Crohn's disease, rheumatoid arthritis, autoimmune haemolytic anaemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetes), allergies, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerular celection (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antibodies and proteins bind conserved epitope of Fas antigen

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA, via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephitis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. Sequences ABB14772-B14774 and ABB14777-B14778 represent the light chains of several humanised HFE7A-derived anti-Fas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; attopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains anti-Fas antibody -

molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas
ligand system, by binding to Fas on the cell surface, and prevents
apoptosis in cells with a normal system, by inhibiting binding between
Fas and its ligand. The products of the invention have anti-inflammatory,
anti-anemic, antidiabetic, anti-alergic, anti-arthritic, antiviral,
immunomodulatory, dermatological, immunousppressive, thyronimetic,
antiarteriosolerotic, cardiant and hepatropic activity. (I) induce
apoptosis by binding to cell surface Fas or inhibit it by competitive
chibibition of ligand binding. (I) are used to treat and/or prevent
chibibition of ligand binding. (I) are used to treat and/or prevent
chibibition of ligand binding. (I) are used to treat and/or prevent
clupus erythematosus, Hashimoto disease, rhemmatoid arthritis, graft
cversus host disease, Sjorgen's syndrome, pernicious or hypoplastic
cutoimmune hemolytic anemia, Goodpasture syndrome, Crohn's
disease, autoimmune hemolytic anemia, sterility, myasthenia gravis,
multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin
dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis,
cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral
(B, C or D) or alcoholic), and transplant rejection. (I) selectively
inhibit apoptosis in normal cells but selectively induce it in abnormal
cells. They bind to both human and murine Fass, so can be evaluated in
murine disease models. (I) act on the active site of Fas, i.e. they minic
murine disease models. (I) act on the active site of Fas, i.e. they minic
che mative ligand, do not induce liver disease, and have reduced risk of
inducing a human anti-murine antibody response. This sequence represents
c a humanised anti-Fas antibody HEPA light chain MM type which is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TFGQGTKLEIKRIVAAPSVFIFPPSDEQLKSGTASVVCLLNNFYPREAKVQWKVDNALQS 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ŏ
                                                                                                                                                                                                                                                                                                                      Sequence 19, Application US/08887352B

Patent No. 5994511

GENERAL INFORMATION:

APPLICANT: Henry B. Lowman, Leonard G. Presta, Paula M. Jardieu, John Lowe
TITLE OF INVENTION: Improved Anti-IgE Antibodies and Method of
TITLE OF INVENTION: Improving Polypeptides

NUMBER OF SEQUENCES: 26

CORRESPONDENCE ADDRESS:
ADDRESSE: Genentech, Inc.
STREET: 1 DNA Way

CITY: South San Francisco
STRATE: California
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

R;Alim, M.A.; Hara, Y.; Hossain, M.S.; Takeda, K.; Yamagata, F.; Yamaki, S.; Kazi, H.

R;Alim, M.A.; Jescription: A new subgroup of k type light chains (vkV) identified in cases of AL

A;Reference number: JE0243

A;Recession: JE0244

A;Rolecule type: protein

A;Residues: 1-215 <ALI>
C;Superfamily: immunoglobulin V region; immunoglobulin homology

C.Species: Mus musculus (house mouse)
C.Species: Mus musculus (house mouse)
C.Accession: S38865
R.Kipp, B.; Becker, W.; Schlaak, M.
submitted to the EAML Data Library, November 1993
A.Description: Combination of a defined specificity and desired isotype by clon: A.Reference number: S38864
A.Accession: S38865
A.Status: preliminary
A.Molecule type: mRNA
A.Status: preliminary
A.Molecule Eype: mRNA
A.Stetus: EMBL:Z27396; NID:9416538; PIDN:CAA81787.1; PID:9416539
C.Superfamily: immunoglobulin V region; immunoglobulin homology
C.Keywords: heterotetramer; immunoglobulin

```
This is the amino acid sequence of the HV type humanised heavy chain of murine anti-human Fas monoclonal antibody HFE7A. It includes humanising R44G and A76T amino acid substitutions that are are conserved in the human igG heavy Chain. Host Escherichia coli pgHPDHV3 SANK 70298 harbors plasmid pgHPDHV3 carrying a fusion fragment of the humanised HV type HFE7A heavy chain and DNA cancoding human igGl constant region (see AAV70080), and is deposited as FERM BP-6273 (citaimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFE7A (see AAW83031-37), like native HFE7A, are capable of inducing apoptosis in abnormal cells. The humanised antibodies are used to evaluate, in animal models, treatments of inducing aced to evaluate, in animal models, treatments of cliseases that involve Fas/Fas ligand interactions, and also creat such diseases, including autoimmune disease, scleroderma, clopus erythematosus, Hashimoto's disease, graft versus host disease, scleroderma, sutoimmune heemolytic anaemia, sterility, myasthenia gravis, multiple scl rosis, Basedow's disease, theumatoid arthritis, autoimmune heemolytic anaemia, sterility, myasthenia gravis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            epitope of Fas antigen

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA, via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in
                                                                                                 Anti-Fas antibody; monoclonal antibody HFE7A; FERM-BP-5828; murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptoals modulator; programmed cell death; autolimnune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephitis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; heavy chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Preventive or treating agent for the diseases caused by an abnormality
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    the Fas/Fas ligand system e.g. autoimmune diseases, contains

This invention describes a novel humanized anti-Fas antibody-like

molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas

ligand system, by binding to Fas on the cell surface, and prevents

co apoptosis in cells with a normal system, by inhibiting binding between

ca anti-almemic, antidiabetic, anti-arthifitic, antiviral, immunomedulatory, dermatological, immunosuppressive, thyromimetic,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel humanized anti-Fas antibody-like molecule (1) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral, immunosuphressive, thyromimetic, antirheumatic, nephrotropic, antinifertility, neuroprotective, antiarteriosclerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   y e.g.

versus host disease, Sjorgen's syndrome, pernicious or hypopiastic anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, autoimmune hemolytic anemia, sterility, mysphenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a humanised anti-Fas antibody heavy chain construct designated Heu I which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                           ö
